### **NAME**

```
archive_write_fail, archive_write_close, archive_write_finish,
archive_write_free — functions for creating archives
```

#### LIBRARY

Streaming Archive Library (libarchive, -larchive)

## **SYNOPSIS**

```
#include <archive.h>
int
archive_write_fail(struct archive *);
int
archive_write_close(struct archive *);
int
archive_write_finish(struct archive *);
int
archive_write_free(struct archive *);
```

#### DESCRIPTION

```
archive_write_fail()
```

Always returns **ARCHIVE\_FATAL**. This marks the archive object as being unusable; after calling this function, the only call that can succeed is **archive\_write\_free**() to release the resources. This can be used to speed recovery when the archive creation must be aborted. Note that the created archive is likely to be malformed in this case;

# archive\_write\_close()

Complete the archive and invoke the close callback.

```
archive_write_finish()
```

This is a deprecated synonym for archive\_write\_free().

```
archive_write_free()
```

Invokes **archive\_write\_close()** if necessary, then releases all resources. If you need detailed information about **archive\_write\_close()** failures, you should be careful to call it separately, as you cannot obtain error information after **archive\_write\_free()** returns.

## RETURN VALUES

These functions return **ARCHIVE\_OK** on success, or **ARCHIVE\_FATAL**.

## **ERRORS**

Detailed error codes and textual descriptions are available from the **archive\_errno**() and **archive\_error\_string**() functions.
